nuclei

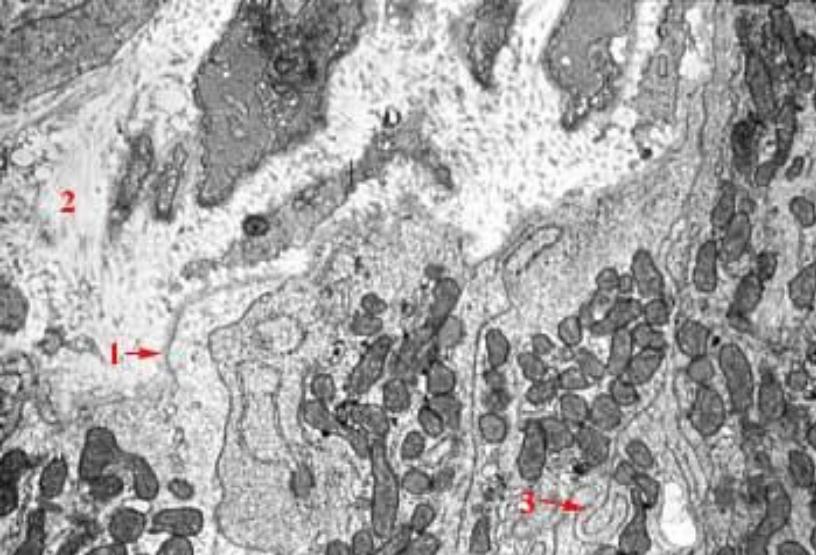

EM 3: Basal portion of intestinal absorptive cells with basement membrane region at the bottom of the image.

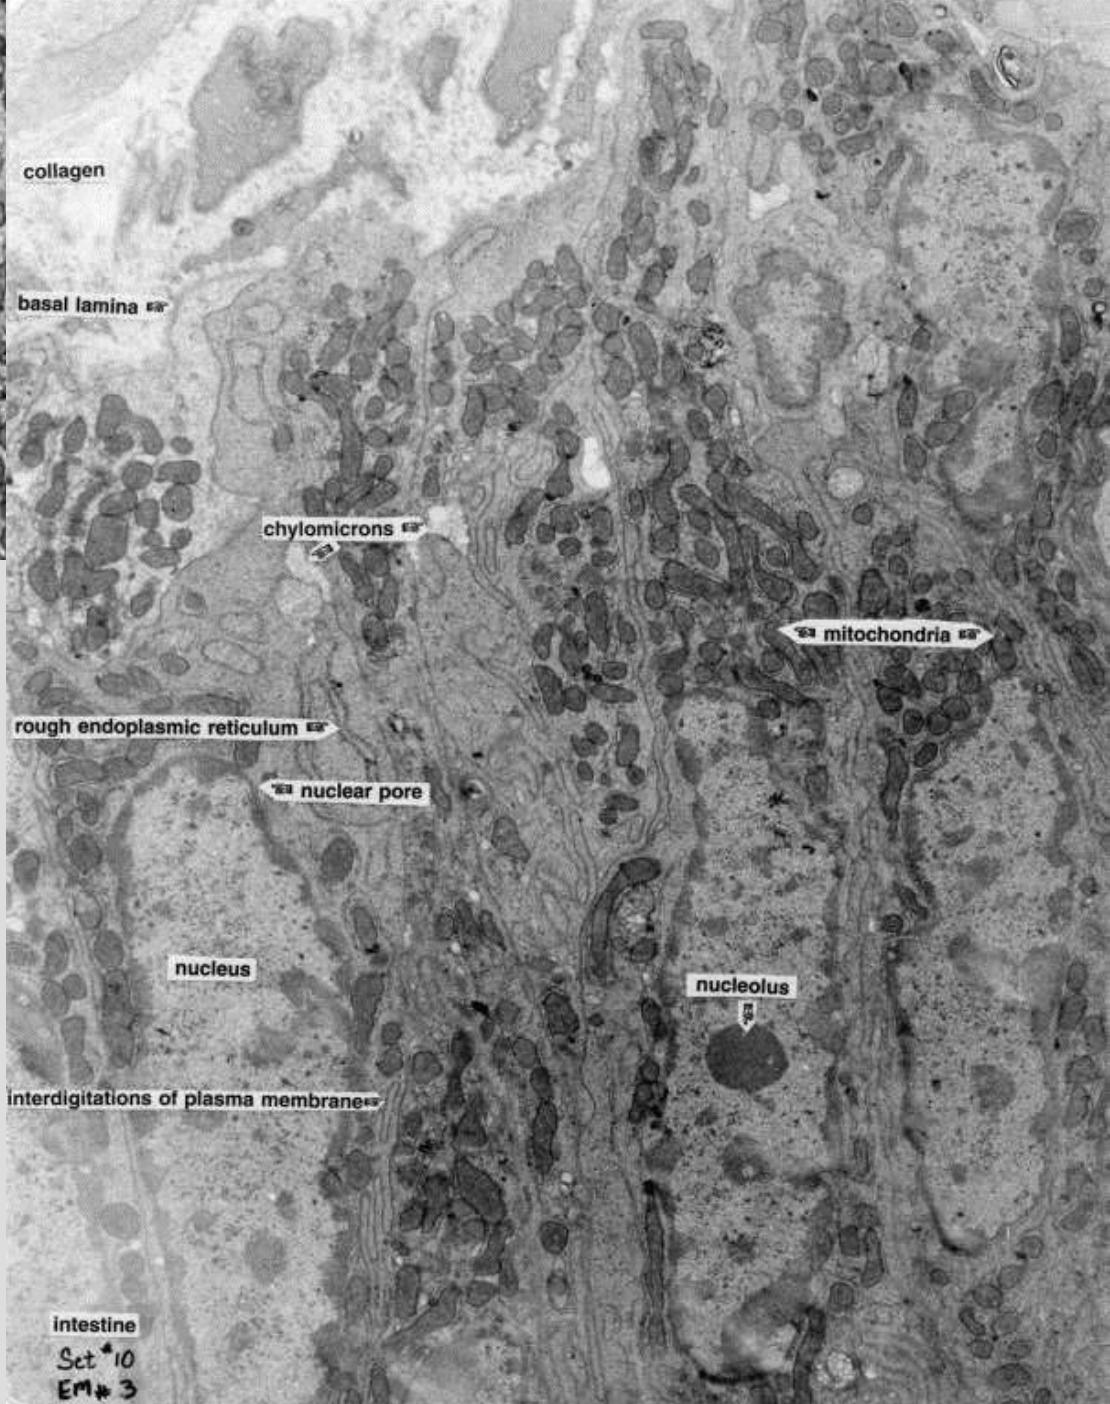

1. Nucleus of intestinal absorptive cell
2. Basal lamina
3. Mitochondria

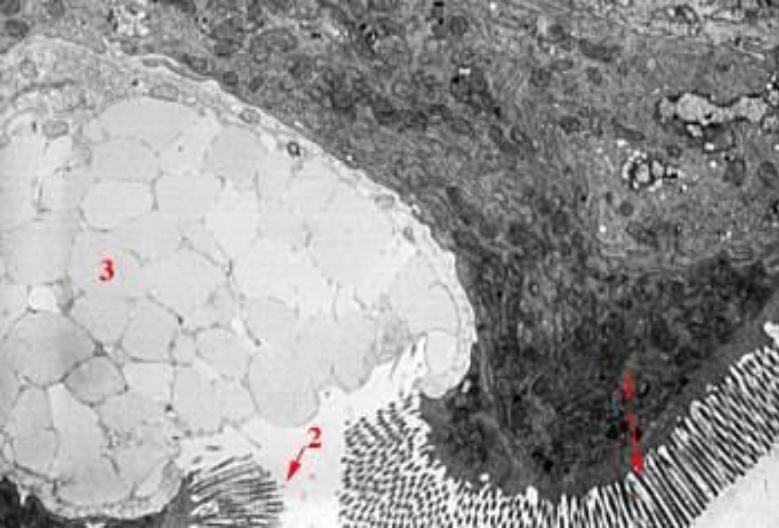

EM 3: (enlargement of section from class print):
The basement membrane region contains collagen fibrils and a fuzzy basal lamina that is adjacent to the plasma membrane at the basal end of the intestinal absorptive cells.

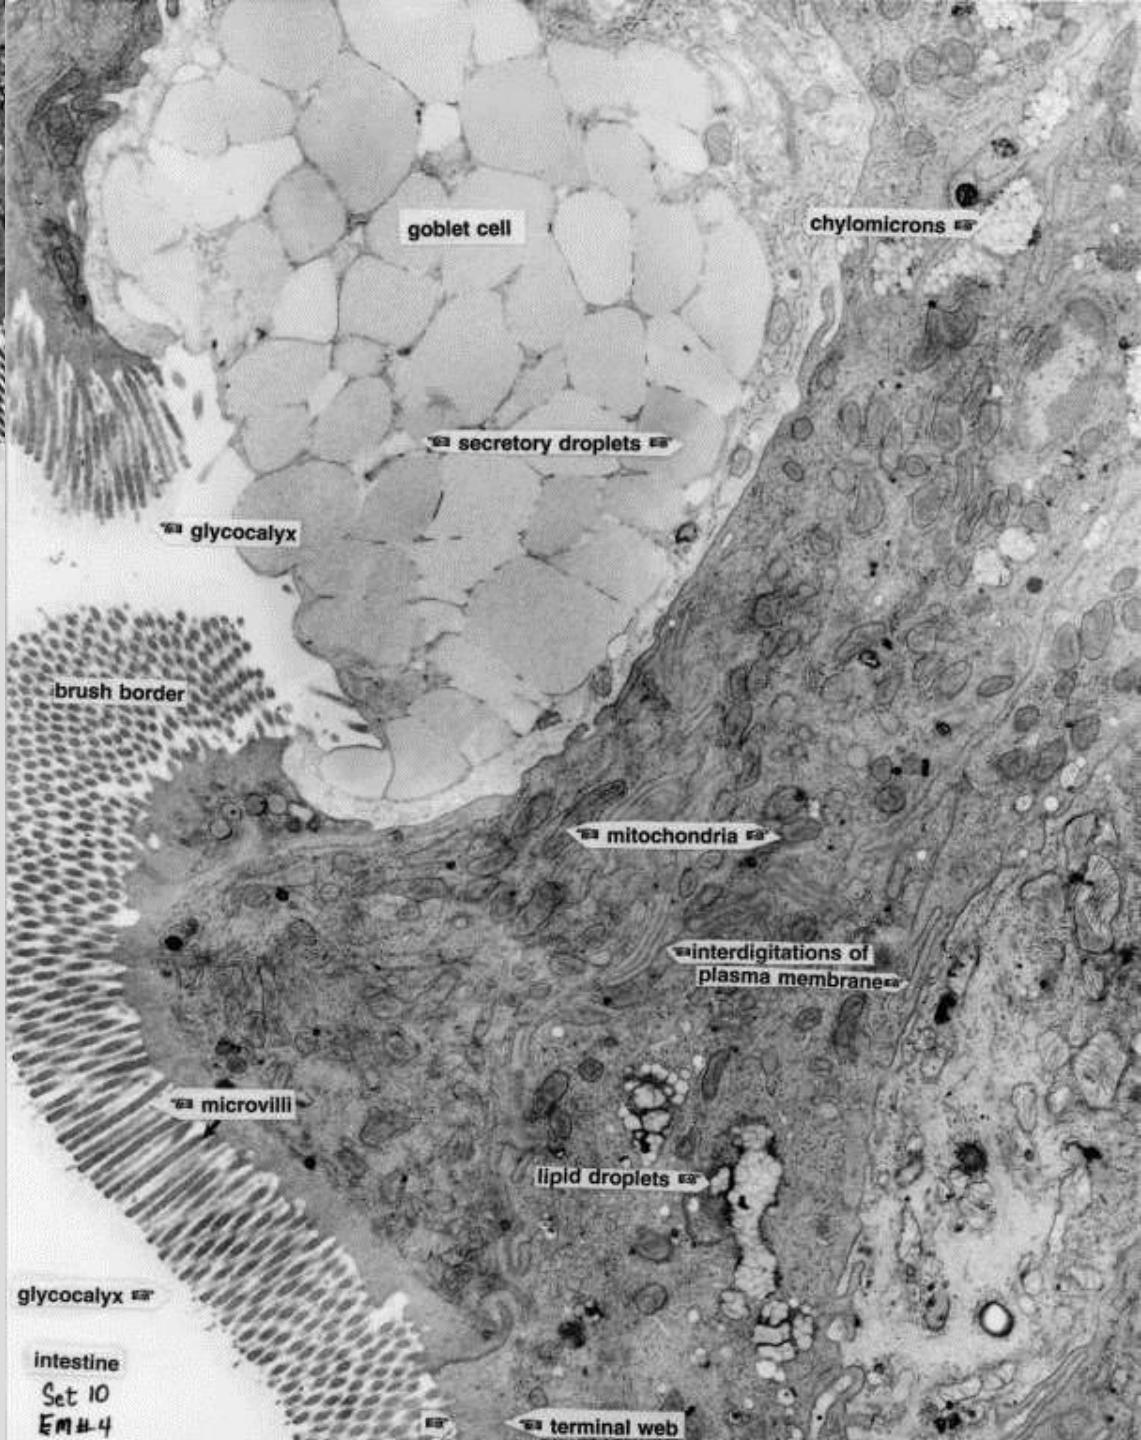

- Basal lamina
- Collagen
- Interdigitation of plasma membrane

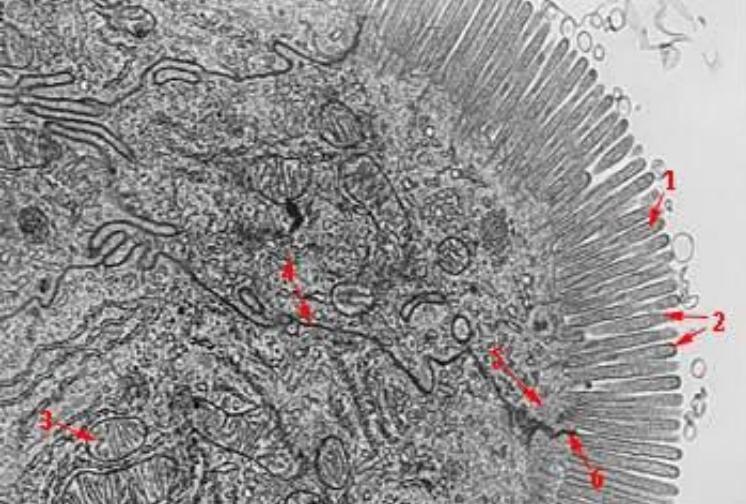

EM 4: Apical end of intestinal absorptive cell with prominent brush border visible. The microvilli of the brush border are coated with a glycocalyx which appears as a fuzzy layer on the luminal aspect of the brush border. A goblet cell occupies part of the image.

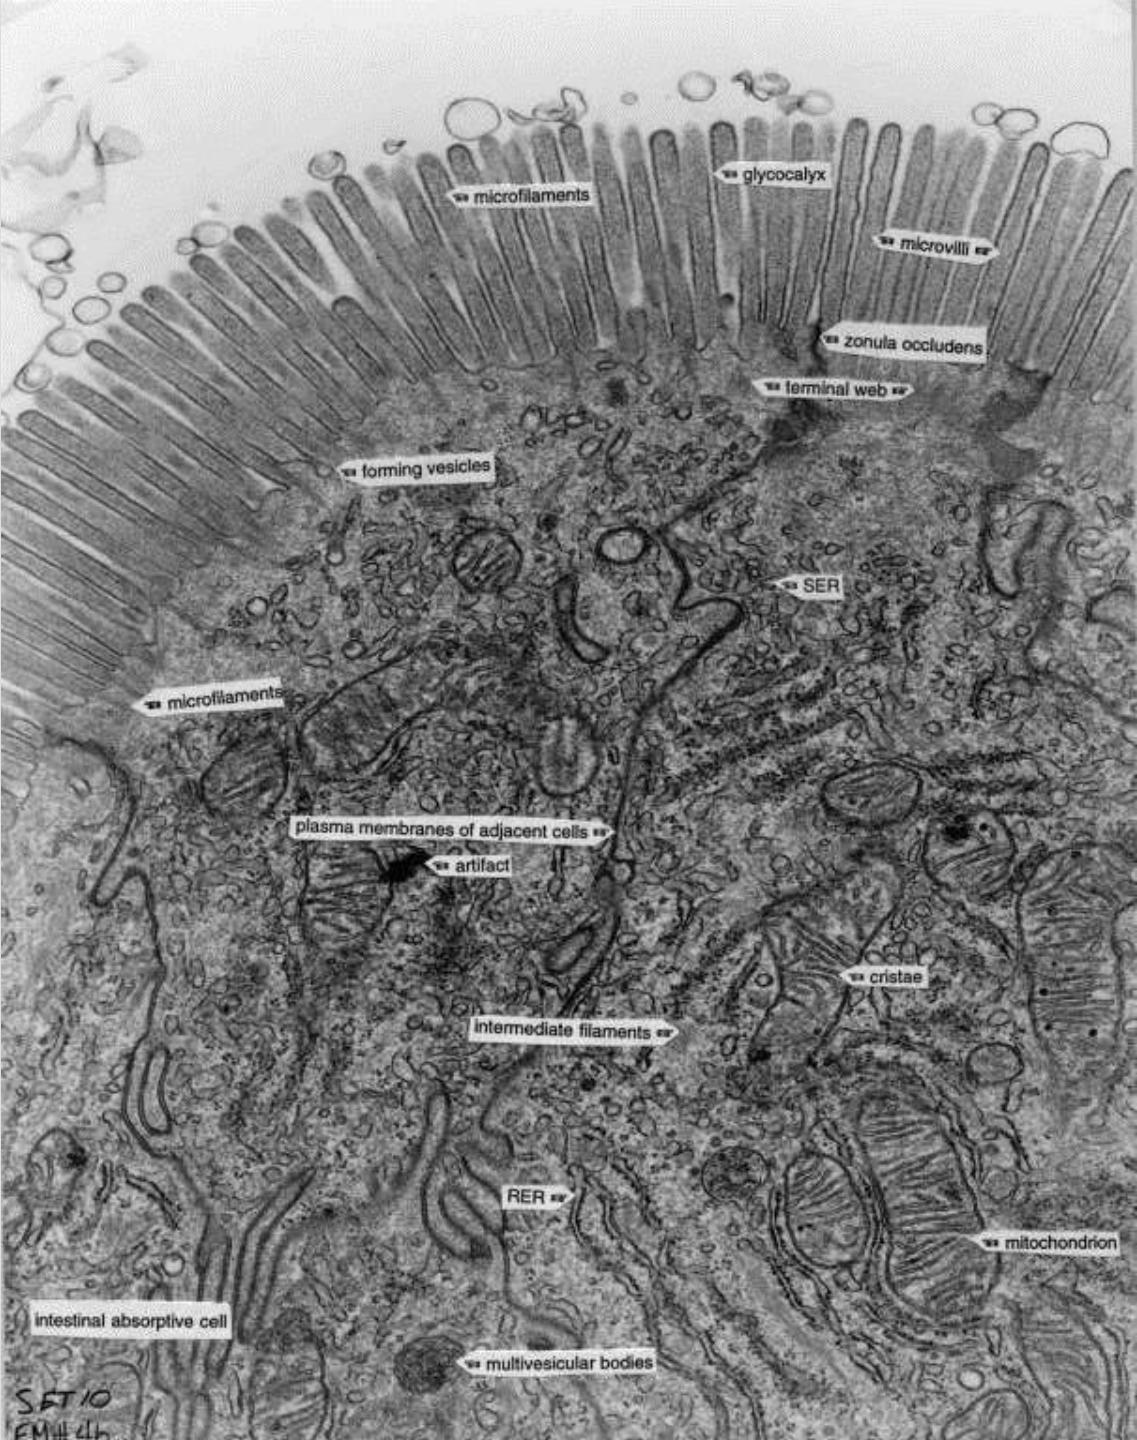

1. Microvilli
2. Glycocalyx
3. Goblet cell

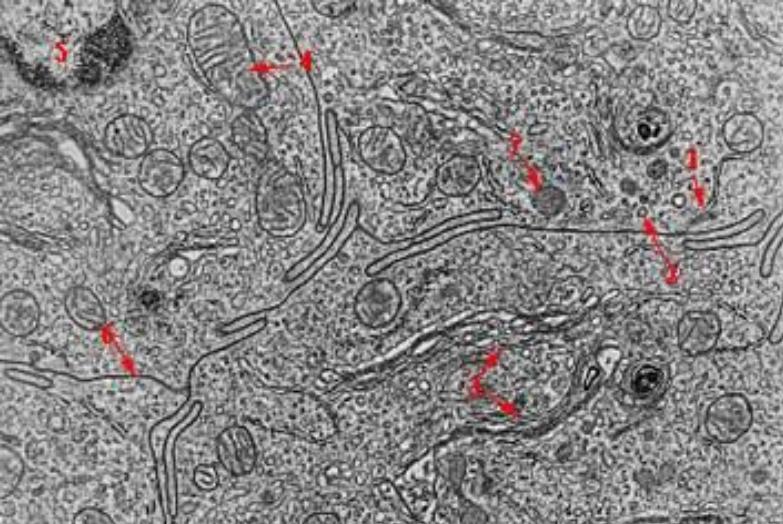

EM 4b: Intestinal absorptive cell (apex);
60,000x.

1. Microfilaments
2. Microvilli
3. Mitochondria
4. Plasma membranes of adjacent cells
5. Terminal web
6. Zonula occludens

EM 4c: Intestinal absorptive cell
(super nuclear region); 60,000x.

1. Budding RER
2. Coated vesicle
3. Golgi
4. Mitochondria
5. Nucleus
6. Plasma membrane
7. Primary lysosome
